

We are trying to incorporate all of the nonrequired and required services under a news stock website (the news stock website is a new service). The required services include WordFilter, Stemming, News Focus, WebDownload, Wsdl Address, and WordCount, while the nonrequired services include Stock Aggregate, Market Holiday, market status, Tickerevent input, stock tracking, and stock news. These services are under the service layer for managing the data. Presentation layer is the gui for the news stock website. The arrows in between the presentation layer and application logic layer are the inputs. Application logic layer takes in the inputs shown in the arrows (inbetween presentation layer and application logic layer) and processed (and taken into the logic shown in the logic application layer) and are used in the services under the service layer.

	Service Directory: The team plan to complete the following services. Changes can be made later in the final project (Project 5).
	This service directory will be deployed at this address*:
	Team name/Number: Group 81

Provider name	Service name, with input and output types	Required service?	Difficult level – self estimate	TryIt link*	Service description	Planned resources need to implement the service
Jesse Jimenez	WebDownload takes input web page url string and outputs string content of given URL and saved into a text file.	Yes	Easy some hints are given in the slide	http://localhost:62894/Service1.svc	Service takes the URL as input and returns its contents and saves it into a text file.	Manually code the implementation to use the service. And ensure to save a string to a local text file.
Jesse Jimenez	NewsFocus takes in a sequence of keywords and returns a list of url news articles related to those articles.	Yes	Moderate as I will need to find an api that will meet this requirement and figure out how it works.	http://localhost:5355/Service1.svc	Service returns a list of urls to news articles related to given keywords by the user.	An api to help search for news articles .
Ahnaf Chowdhury	WordFilter Input: String Output: String	Yes	Moderate	...TryIt link*	Filters out like the prepositions and conjunctions of the top words in search (and XML element tag names and attribute names)	Google and Slides
Ahnaf Chowdhury	Stemming Input: String Output: String	Yes	Moderate	TryIt link*	From analyzing a text file, generate the root keyword that come from the groups of strings and replace each	Google and Slides

					string in group by the root keyword	
Mridul	WordCount. Inputs: Text File containing Strings. Output: JSON of a word and its occurrences.	Yes	Moderate	TryIt link*	Once a file is inputted into this service, the key is described as a word for the search parameter. After the strings are analyzed on the page, the analysis is used to count every occurrence of the key.	Write my own code for reading in the strings from the text file and keep a counter(key) for every word is how I will implement this service
Mridul	Return WSDL Addresses. Input: Webpage URL Output: Array of Strings	Yes	Moderate to Difficult		After a website's URL address is entered in the input box, the service will analyze the webpage and return all the WSDL addresses from that page in an array of strings.	In order to get the WSDL addresses from a webpage, I will take the given inputted URL and convert the WSDL data into an array of strings.
Jesse Jimenez	Stock news search, input : string, output: string of news about stock.	No	Easy	N/A	Service will take in a stock ticker and return news related to that stock,	Use the Polygon Stock API service to get news for specific stock.
Jesse Jimenz	Stock tracking, input: string of stock symbol, output:	No	Easy	N/A	Service will take in a stock ticker and return the last	Use the Polygon stock api to get the

	returns last price of stock trade				stock trade price.	latest stock trade price.
Ahnaf Chowdhury	Stock Aggregate (Bars) Input: from (date) and to (date) and stockTicker Output: JSON file with an array of numbers (close price, open price, number of transactions, etc.)	No	Easy	N/A	Service will get the necessary stock information over time.	Use the Polygon stock api to get the stock information over a given date time range.
Ahnaf Chowdhury	Market Holidays Input: date of the holiday (like user selects the day and it outputs if there is a holiday that day), which market the record is for, name of holiday, Output: market open time holiday, status of market on holiday, and market close time holiday.	No	Easy	N/A	Returns holidays where stock exchange dates are closed.	Use the Polygon stock api to get the holiday dates where stock exchange dates are closed.

Mridul	Ticker Events Input : string symbol of stock. Output: Returns JSON data.		Easy	N/A	The service returns events associated with corresponding stock symbols.	Using the Polygon api to get the events of a stock .
Mridul	MarketStatus: input bool value, string name. Output: Returns JSON data.		Easy	N/A	The service returns status of specified exchanges.	Use the polygon api to complete this service.
